

# AUTOTASK WORKPLACE SERVER

Effective collaboration on company documents

## Introducing Workplace Server

Are rudimentary file sharing tools like FTP, VPN and thumb drives slowing down productivity for your business? Do you have mobile workers who need the ability to collaborate more easily on critical business files, anytime, anywhere? Are you putting the right strategy in place to protect important business data from a Ransomware attack?

Workplace Server is a purpose built add-on to Autotask Workplace Service, an enterprise grade File Sync & Share (FSS) solution that improves file security, sharing and collaboration for everyday business users. Workplace Server uses performance efficiencies from local area networks to provide effective collaboration on company documents that have both on-site and remote employees. Here's what it means for you:

### **Saves Time and Increases Productivity**

Workplace Server bridges the gap and syncs between in-house File Servers and Remote Workers. It will save customers hours of time, by providing near real-time collaboration between back office and employees who work from a remote location or travel extensively.

### **Provides Access to Data Securely and Seamlessly**

Workplace Server will improve data security and ensure business continuity risks are minimized due to less Email, FTP and VPN use with exposed attachments, while also providing a 6 month archive of deleted files.

### **Enhances Collaboration**

Workplace Server allows employees to easily collaborate regardless of location. It has integration with Microsoft File Locking technology so that a company's employees can work together whether they are in an office or on the go.

### **Reduces Technological Complexity**

It removes the need for using outdated technologies like FTP, VPN and Share Point —reducing the hassle for you and saving your company money.
